

## Unit 2: Ch 5.2-5.3 - Electron Configurations #3: Noble Gas Notation

### REVIEW: ORBITALS

- Each \_\_\_\_\_ has \_\_\_\_\_ containing \_\_\_\_\_.
  - In **ANY** \_\_\_\_\_ orbital = \_\_\_\_\_ maximum.
- Number of \_\_\_\_\_ in a \_\_\_\_\_ is \_\_\_\_\_ to the number of \_\_\_\_\_ of electrons within that sublevel.
  - “s” sublevel → \_\_\_\_\_ orbital → \_\_\_\_\_ electron pair → \_\_\_\_\_ electrons max
  - “p” sublevel → \_\_\_\_\_ orbitals → \_\_\_\_\_ electron pairs → \_\_\_\_\_ electrons max
  - “d” sublevel → \_\_\_\_\_ orbitals → \_\_\_\_\_ electron pairs → \_\_\_\_\_ electrons max
  - “f” sublevel → \_\_\_\_\_ orbitals → \_\_\_\_\_ electron pairs → \_\_\_\_\_ electrons max

### Electron Configurations: PERIODIC TABLE

- The periodic table organizes \_\_\_\_\_ and \_\_\_\_\_ into \_\_\_\_\_.
  - **Period** -
  - **Groups/Families** -

### BOHR MODEL to Electron Configurations:

- **DEFINITION** -
- Ex: Oxygen (O) → e<sup>-</sup> config (longhand): \_\_\_\_\_
- Ex: Neon (Ne) → e<sup>-</sup> config (longhand): \_\_\_\_\_
- Ex: Titanium (Ti) → e<sup>-</sup> config (longhand): \_\_\_\_\_
- Ex: Rubidium (Rb) → e<sup>-</sup> config (longhand): \_\_\_\_\_

## VALENCE ELECTRONS:

### ➤ DEFINITION -

- Valence electrons \_\_\_\_\_ determine \_\_\_\_\_ of atoms.

### ➤ Identity of Valence Electrons:

- Ex: Cobalt (Co) → e<sup>-</sup> config (longhand): \_\_\_\_\_
  - IDENTITY of valence e<sup>-</sup>: \_\_\_\_\_
  - NUMBER of valence e<sup>-</sup>: \_\_\_\_\_
- Ex: Oxygen (O) → e<sup>-</sup> config (longhand): \_\_\_\_\_
  - IDENTITY of valence e<sup>-</sup>: \_\_\_\_\_
  - NUMBER of valence e<sup>-</sup>: \_\_\_\_\_
- Ex: Yttrium (Y) → e<sup>-</sup> config (longhand): \_\_\_\_\_
  - IDENTITY of valence e<sup>-</sup>: \_\_\_\_\_
  - NUMBER of valence e<sup>-</sup>: \_\_\_\_\_

## PUTTING IT ALL TOGETHER: NOBLE GAS NOTATION

### ➤ 1)

### ➤ 2)

- Must follow the \_\_\_\_\_ rules for \_\_\_\_\_ elements as well.
- Ex: Fluorine (F) = \_\_\_\_\_ e<sup>-</sup> config (longhand): \_\_\_\_\_
  - Orbital Notation:
  - Noble Gas Notation: Identity / # valence e<sup>-</sup> :
- Ex: Nickel (Ni) = \_\_\_\_\_ e<sup>-</sup> config (longhand): \_\_\_\_\_
  - Orbital Notation:
  - Noble Gas Notation: Identity / # valence e<sup>-</sup> :
- Ex: Bismuth (Bi) = \_\_\_\_\_ Noble Gas Notation: \_\_\_\_\_
  - Identity / # valence e<sup>-</sup> :
