## Extra Practice: Phase Diagrams \#2

Name: $\qquad$

Phase diagram for mysterious compound $X$

For each of the questions below, refer to the phase diagram shown above for mysterious compound, $X$.
1). If you were to have a bottle containing compound X in your closet, what phase would it most likely be in?

$$
\text { Gas } \rightarrow \text { High Pressure of Temp }
$$

2) At what temperature and pressure will all three phases coexist?

$$
\text { Triple Point }(T)=350^{\circ} \mathrm{C} @ 50 \mathrm{~atm}
$$

3) If I have a bottle of compound $X$ at a pressure of 45 atm and temperature of $100^{\circ} \mathrm{C}$, what will happen if $I$ raise the temperature to $400^{\circ} \mathrm{C}$ ? (Specify phase change.)
Sublime into gas from solid
4) If compound $X$ is nontoxic, would you be able to drink it in the liquid form?

No, it would be too hot!
5) If I have a bottle of compound $X$ at a pressure of 70 atm and temperature of $750^{\circ} \mathrm{C}$, what will happen if I lower the temperature to $600^{\circ} \mathrm{C}$ ? (Specify phase change.)

## Condense from gas to liquid

Refer to the phase diagram below when answering the following questions.

6) What is the normal freezing point of this substance? © $1.00 \mathrm{~atm}=100^{\circ} \mathrm{C}$
7) What is the normal boiling point of this substance? @ $1.00 \mathrm{~atm}=\sim 375^{\circ} \mathrm{C}$
8) What is the normal melting point of this substance? © 1.00 atm $=100^{\circ} \mathrm{C}$
9) If I had a quantity of this substance at a pressure of 1.25 atm and a temperature of $300^{\circ} \mathrm{C}$ and lowered the pressure to 0.25 atm , what phase transitions) would occur?

$$
\frac{\text { Boil/Vaporize @~0.8 7atm }}{\text { from liquid to gas }}
$$

10) At what temperature do the gas and liquid phases become indistinguishable from each other?

$$
\frac{\text { Critical Point (c) }}{\sim 825^{\circ} \mathrm{C} @ \sim 1.56 \mathrm{~atm}}=
$$

11) If I had a quantity of this substance at a pressure of 0.75 atm and a temperature of $-100^{\circ} \mathrm{C}$, what phase changes) would occur if I increased the temperature to $600^{\circ} \mathrm{C}$ ? At what temperatures) would they occur?

$$
\text { Mett@~100 }{ }^{\circ} \mathrm{C} \text {, then boil } 160^{\circ} \mathrm{C}
$$
